DEVICE TEST

1, Explain behaviour of hub device

- Hub used to Connect multiple network device
- It is Layer 1 device.
- Broadcast device
- It follows half-duplex method like walkie talkie.
- Data Collision occurs when two data flows simultaneously.
- Mostly not used by Companies.

2, Explain behaviour of switch device

- It is a Intelligent device
- It is Layer-2 device & Contains mac Table.
- Connects multiple network device.
- It uses Address learning method for Creating mac table.
- But it sometimes causes Heavy traffic by ARP request by Single Broadcast domain process.
- Incoming requests as Broadcast &
- Outgoing requests as Unicast.

3, Explain behaviour of router device

- It is used to break Single Broadcast domain problem.
- used to Connect different multiple networks.
- It is Called Layer-3 device.
- It also Contains Routing table alike mac table.
- It is followed by Directly Connected Router.
- Routing table Contains list to route networks & data.
- No Collision occurs as data is Unicast all the time.
