1, Explain uses of ping command in network ?

PING → Packet Internet Groper

It is a command which is used to generate some dummy data (echo) and transfer to other IP Pc and again returned to the original IP Pc. Then this process is known as Bi-directional ping.

2, Explain netbios protocol ?

NetBios is a protocol used to find the target IP with the help of Target System name. This happens over a LAN network. It means Network Basic Input/output System.

3, Explain SMB protocol ?

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

First a ICMP echo data is generated and moves in the application layer. Next the echo data moves to the presentation layer and format encapsulation is added to it. Then it moves to the session layer where it has session time-out & session encapsulation is added, and then goes to transport layer for data transportation. Then moves to the network layer where it follows IP protocol & packet encapsulation occurs in this layer where source & destination IP is added then moves to the data-link layer where it follows ethernet protocol & frame encapsulation & Mac encapsulation occurs, where source & destination mac is added & finally goes to physical layer & then echo data is transmitted.
